In the original published paper,<sup>1</sup> in Fig. 1(d), the right-hand edge of the white box showing the blob analysis zone was drawn incorrectly. The corrected box with a radial width of 7.5 cm is shown below. A few words have also been added to the caption. None of the data analysis in the paper is affected by this figure correction.

On the third line of Sec. III C, the reference to “Table I” should be to “Table II.”

In the next-to-last sentence of Sec. III D, the word “lower” should be replaced with “higher.”

Also, at the end of the caption of Fig. 14, the reference should be to Ref. 33, not Ref. 27.

**FIG. 1.** (a) Image showing the time-averaged GPI signal level for shot No. 142270 along with the local separatrix (dashed white line), the RF limiter shadow (dotted white line), and the GPI gas manifold (solid white line). The signal level peaks about 1 cm inside the separatrix. (b) A single frame with a blob in the same color scale, and this same frame in a normalized image with a blue color scale of 0 (black) to 10 (white) (c). (d) The relative number of frames having a normalized signal level  $\geq 3$  (red = 6%), along with a white box showing the blob analysis region used for this paper, with the limiter shadow shown as a dotted line.
